

Web apps — speed cleanup

17 August 2026 · every item re-checked in the code today, on dev

Both web apps download a lot of things nobody uses. This is a list of what to remove and what to load later. Every item has been checked in the code, so you should find exactly what is described.

Nothing a user sees should change. Same screens, same behaviour, same look — only faster. If any item turns out to need a visible change, stop on that one and tell us instead of deciding.

Stay inside the list. Do not tidy anything else while you are in there, and do not touch the prototype pages.

REMOVE WHAT IS NOT USED

1 Client panel & admin

A spreadsheet library nobody imports FIX

Both apps install xlsx. It is 7.8 MB and there is not a single import of it anywhere in either app — spreadsheets are produced by the backend and simply downloaded. It is also pulled from a direct link to the vendor's own site rather than the normal registry, which means our security scanning never looks at it.

Do: remove it from both apps and from the lockfile.

2 Shared UI package

A second charting library that draws nothing FIX

We ship two chart libraries. Every chart you can actually see uses the first one. The second, Plotly, is used by exactly one component — a histogram — and that histogram is not on any screen: the only thing that renders it is never rendered itself, and the one page that imports it does not use the import. So it is downloaded and never drawn.

Do: confirm nothing renders the histogram, then delete the library, the histogram component, and the dead import and chunk rule that go with it.

3 Client panel & admin

Fonts fetched on every page load that the product never uses FIX

Both apps request several font families from Google on every visit. The live product only uses Inter, Inter Tight and JetBrains Mono. Manrope, Noto Sans and Hanken Grotesk are referenced by nothing except the prototype's own styling — so every customer downloads them for no reason.

Do: remove those three from both apps. If the prototype needs them, load them from inside the prototype only, so its look does not change.

LOAD LATER INSTEAD OF UP FRONT

4 Client panel & admin

Five languages are downloaded to show one FIX

Every user gets all five translation files before the app starts — around a megabyte of text, of which they read a fifth. They are all imported directly and registered at startup.

Load only the language in use, and fetch another one if the user switches. Expect a short wait the first time someone changes language; that is fine and expected.

Do: both apps. This is the single biggest saving on the list and it touches no page. Check afterwards that all five still display correctly, including a switch while signed in.

5 Client panel

The comparison pages build a PDF nobody asked for **FIX**

The four comparison result pages start building the whole downloadable PDF the moment the page opens, even though most users never press Export. The single-assessment download already does it properly — it only builds when the user clicks — so copy that pattern.

Do: build on click on all four. Check the exported file is identical to what it is today.

6 Client panel

Three pages load on every visit that almost nobody opens **FIX**

Every page in the app is loaded on demand except three — the invitation page and the two privacy policy pages — which are pulled in at startup for everyone. They are a large part of what is downloaded before the login screen even appears.

Do: load them on demand like the rest. Check all three still open from a direct link, signed out.

7 Admin

The admin app downloads as one large file **FIX**

Nothing works until all of it has arrived, and any library update forces returning users to download the whole thing again. The client panel is already split into separate pieces for the big libraries; the admin app has none of that.

Do: copy the client panel's split into the admin build.

LAST STEP

8 Measure it and send us the numbers **REPORT**

Before you start, build both apps and write down how much is downloaded before the login screen appears. Do the same at the end.

Send back: before and after, per app, and anything on this list you could not do and why.

All eight are pure speed work — there is no product decision anywhere in this list. If you hit one, stop and ask rather than choosing.
